

Genawise Loan Manager Corporate

The system is designed to manage a portfolio of loans for private and corporate lenders. It is a Windows based software system that utilises a Microsoft SQL Database system.

The system has evolved from that first developed in 2000.

The system is in use in most Australian states and usage is growing steadily. Many varied and highly tailored versions are in use today. We now only offer a more standardized system filling most user's needs.

Our lead programmer, John Griffiths, based the design on nearly 25 years experience in a leading Australian bank. He has over fifteen years experience in programming and has a business degree with a major in information systems.

System Features

- User Definable "Account Types"
- Charge interest on Loans, Pay interest on Deposits (new March 2007)
